Featuring 775 full-color illustrations, this atlas demonstrates the surgical approaches used in orthopaedics and provides a surgeon's-eye view of the relevant anatomy. Each chapter details the techniques and pitfalls of a surgical approach, gives a clear preview of anatomic landmarks and incisions, and highlights potential dangers of superficial and deep dissection. The Fourth Edition describes new minimally invasive approaches to the spine, proximal humerus, humeral shaft, distal femur, proximal tibia, and distal tibia. Other highlights include new external fixation approaches for many regions and surgical approaches to the os calcis. New illustrations of the appendicular skeleton are included. New drawings show the important neurovascular structures that need to be protected.

## **The Orthopaedic Physical Examination**

Physical Examination in Orthopaedics is a concise colour illustrated book structured around the three-stage system of examination - LOOK, FEEL and MOVE - advocated by the authors. In recognition of the importance of the positioning of both examiner and patient at every stage, the text is fully illustrated on a point-by-point basis with colour figures. These feature the authors as examiners, and each chapter contains both examination technique details and actual examples of abnormalities that may occur. The chapters are based on examination of specific parts of the body, taking a systematic approach. Extremely clear and easy to use, the text has been designed so that the reader can quickly refer to the specific area of interest.

## **Bedside Clinics in Orthopedics**

This book is derived from Ronald McRae's Pocketbook of Orthopaedics and Fractures, a highly successful 'survival guide' for the trainee working in accident and emergency or orthopaedic departments. Retaining the underlying principles of the original editions this comprehensive rewrite and representation provides complete coverage of orthopaedic trauma surgery as relevant to contemporary practice. McRae's Orthopaedic Trauma and Emergency Fracture Management utilises a detailed descriptive and didactic style, alongside a wealth of illustrations all completely redrawn for this book. The first section on general principles in orthopaedic trauma deals with basic terminology and classification, principles of closed and operative management of fractures, infection and complications. The main section provides a regional review of specific injuries, each following a logical sequence describing emergency department and orthopaedic management, and outlining a safe and widely accepted management strategy. Each chapter begins with an overview of the relevant anatomy and principles of the examination of the patient. The book provides a comprehensive overview of both surgical as well as conservative management of orthopaedic trauma injuries. This book is a fully rewritten text

and it is difficult finding the right textbook that will give them a sufficient level of knowledge and help them through their examinations. "Textbook of Orthopaedics" is just such a book, giving more than enough information, while at the same time focussing on the main goal - passing the orthopaedics exam. The book is divided into 8 sections, which deal with the obligatory, standard areas of study, such as general orthopaedics, regional injuries, and both traumatic and non-traumatic disorders. But there are also innovative sections which discuss amputations, prosthetics, sports medicine, arthroplasty and arthroscopy, and the final section of appendices gives information about orthopaedic implants and instrumentation in common use, as well as tips and hints for practical exam sessions. The book is very "student friendly" with numerous excellent pedagogical features - diagrams, end of chapter summaries, flow charts, mnemonics, differential shading of tables and columns, anecdotes, jokes, and historical references. X-rays are found at the end of each chapter and there is also a focus on back ache, a very common orthopaedic problem often neglected by other textbooks. In short "Textbook of Orthopaedics" is an exam-oriented textbook designed and written specifically for medical undergraduates.

ter, metal-to-metal design dominated the field. During that considerable period general satisfaction with the early results rendered criticisms of the large-diameter head unwelcome. There was a formidable array of counter criticism: the small head would pierce a film of synovial fluid; the small head would wear the socket too rapidly; the small head would always have a high risk of dislocation; detachment of the trochanter, to achieve precise orientation for the small head, was unacceptable. But all these objections have now been largely overcome. Lubrication of high molecular weight polyethylene (HMWP) on metal is now accepted as being mainly by the boundary regime with thick fluid films playing no part. We now know that HMWP can indeed tolerate the very high stresses imposed by the small head and in tribological theory there may even be some advantage in high stress. Dislocation is now known not to be an automatic sequel to the small head.
