Everything I Know about Women I Learned from My Tractor

The right to a healthy environment has been the subject of extensive philosophical debates that revolve around the question: Should rights to clean air, water, and soil be entrenched in law? David Boyd answers this by moving beyond theoretical debates to measure the practical effects of enshrining the right in constitutions. His

pioneering analysis of 193 constitutions and the laws and court decisions of more than 100 nations in Europe, Latin America, Asia, and Africa reveals a positive correlation between constitutional protection and stronger environmental laws, smaller ecological footprints, superior environmental performance, and improved quality of life.

This book describes technology used for effective sensing of our physical world and intelligent processing techniques for sensed information, which are essential to the success of Internet of Things (IoT). The authors provide a multidisciplinary view of sensor technology from materials, process, circuits, to big data domains and they showcase smart sensor systems in real applications including smart home, transportation, medical, environmental, agricultural, etc. Unlike earlier books on sensors, this book provides a "global" view on smart sensors covering abstraction levels from device, circuit, systems, and algorithms.

Handbook of the Economics of Innovation

Bousquet's book considers the impact of key technologies and scientific ideas on the practice of warfare and the handling of the perennial tension between order and chaos on the battlefield. It spans the entire modern era, from the Scientific Revolution to the present, eschewing traditional accounts of technological change in war and instead exploring modern warfare as the constitution of increasingly complex social assemblages of bodies and machines whose integration has been made possible through the deployment of scientific methodology. Scientific conceptual frameworks have been increasingly applied to the theoretical understanding of war, particularly when they have been associated with influential technologies such as the clock, the engine, or the computer.Conversely, many scientific developments have been stimulated or conditioned by the experience of war, especially since the Second World War and the unprecedented technological and industrial effort that characterised it. The constitution and perpetuation of this scientific way of warfare, marked by an increasingly tight symbiosis between technology, science, and war, are best understood in the context of the state's attempts to make war into a rational instrument of policy. Bousquet also explores the relative benefits (such as providing a unique chain of command over the decision to use nuclear weapons) and disadvantages of centralising and

decentralising approaches to military affairs, as exemplified in network-centric theory and in the activities of non-state actors such as insurgents.

The Larger Life

Love, Sex and Tractors

J. M. Adovasio has spent the last thirty years at the center of one of our most fiery scientific debates: Who were the first humans in the Americas, and how and when did they get there? At its heart, The First Americans is the story of the revolution in thinking that Adovasio and his fellow archaeologists have brought about, and the firestorm it has ignited. As he writes, "The work of lifetimes has been put at risk, reputations have been damaged, an astounding amount of silliness and even profound stupidity has been taken as serious thought, and always lurking in the background of all the argumentation and gnashing of tenets has been the question of whether the field of archaeology can ever be pursued as a science."
