important educational reference source for health care scientists active in the field of parasitology. The first four sections cover different groups of parasites, including intestinal protozoa; blood and tissue protozoa; cestodes, trematodes, and intestinal nematodes; and blood and tissue nematodes. The last section covers challenging cases and details non-parasitic infections in patients with symptoms closely resembling those of parasitic infections. Each case study opens with a patient history and description of symptoms, and most are accompanied by a color image of the parasite described. Thought-provoking questions are posed, covering everything from diagnosis and the life cycle of the identified parasite to epidemiology and prevention. The questions stimulate discussion while emphasizing the relationship of diagnosis to patient care. Cases present new, emerging, and well-known parasites, and parasites infrequently encountered in the United States are included. The book concludes with a glossary of descriptive terms. Cases in Human Parasitology is an excellent reinforcement of material learned in a clinical or laboratory setting. It will be useful for pathology residents and infectious disease fellows in preparing for board exams and it will serve in continuing the education of medical technologists involved in diagnostic parasitology"--Publisher's website.

Macrocyclic lactones are chemical compounds that represent the main treatment for parasitic diseases of animals, not only for helminth infections, but also a number of major ectoparasitic infestations. There has been no comprehensive book on this subject for more than a decade and this book fills this gap and provides

detailed coverage of the basic science of these drugs and their mode of action, as well as their clinical use in farm and companion animals and in humans.

Host Manipulation by Parasites

Our immune system is a complex network of cells continually battling against a barrage of attacks from our environment, quite literally to save our lives. But what protects us from the potentially life-threatening microorganisms that surround us every day? Infection and Immunity describes the main causes of infection that our bodies have to battle against - from bacteria to viruses, fungi to protozoa - and explains the intricate and fascinating ways in which we respond, from detection of potentially dangerous organisms to their ultimate elimination. Presenting a fully-rounded, well-balanced overview of the field, the book also explains how diseases spread, and what measures we can take to control this spread - from vaccination to increasing awareness through public health initiatives.

Helminths, parasitic worms, are the most common infectious agents of humans in developing countries producing a global disease burden that exceeds better-known conditions, including malaria and tuberculosis. However, despite the fact that helminthic diseases affect approximately one billion people in the world annually, they've been prominent among the so-called neglected tropical diseases (NTDs) until recently.

555 Questions in Veterinary and Tropical Parasitology

Ectoparasites are of growing significance in modern veterinary medicine and a detailed understanding of the biology of these parasites is fundamental to their appropriate treatment and control. The authors of this book have therefore provided a complete overview of the biology, and behaviour of arthropod ectoparasites along with the pathology and treatment of diseases in livestock and companion animals of temperate habitats. This is the only up-to-date book available written specifically for practitioners and students of veterinary medicine, animal husbandry and applied animal sciences. Such a unique volume is essential because in veterinary parasitology, ectoparasites such as the lice, mites, ticks, fleas or dipteran agents of myiasis assume far greater prominence than in other parasitological disciplines. Ectoparasite infestation of domestic and companion animals, therefore, has overt clinical features requiring a distinct approach to diagnosis and control. This book has been written with this in mind. The text takes a unique integrated approach combining both ectoparasite biology and veterinary dermatology. In the second edition of this successful book (previously, entitled *Veterinary Parasitology*), the detailed coverage of individual ectoparasite species

has been expanded. Up-to-date information of new veterinary drugs and modes of application has been included and the practical clinical relevance of the information has been strengthened.

Diseases caused by animal parasites remain, on a worldwide basis, among the principal causes of morbidity and mortality. This book gives the medical student and the practitioner the basic information about parasitic protozoa, worms, and arthropods and the diseases they cause that will enable the reader to recognize and manage them. One is impressed with the broad scope of the subject, the diversity of the parasitic modes of life, and how much there is yet unknown about the biology of parasitism. At the same time the book provides vignettes of the often fascinating historical background of our knowledge of animal parasites and glimpses of current research that is beginning to shape the future of parasitology.

William Trager, PH.D. Professor Emeritus of Parasitology The Rockefeller University New York, New York

Preface This book fills the need we have felt in teaching parasitic diseases to medical students. Many of the available texts are too detailed for what is inevitably an introductory course; others that do treat this subject with appropriate brevity are now out of date; still others lack documentation of references and thus fail to guide the readers to a broader understanding of this subject. We have addressed ourselves to medical students, but they are not our sole target. Clinicians unfamiliar with the complexities of parasitic diseases need a guide to the diagnosis and management of these infections. We intend our book to serve this function as well.
