What is the best way to photograph a speeding bullet? Why does light move through glass in the least amount of time possible? How can lost hikers find their way out of a forest? What will rainbows look like in the future? Why do soap bubbles have a shape that gives them the least area? By combining the mathematical history of extrema with contemporary examples, Paul J. Nahin answers these intriguing questions and more in this engaging and witty volume. He shows how life often works at the extremes--with values becoming as small (or as large) as possible--and how mathematicians over the centuries have struggled to calculate these problems of minima and maxima. From medieval writings to the development of modern calculus to the current field of optimization, Nahin tells the story of Dido's problem, Fermat and Descartes, Torricelli, Bishop Berkeley, Goldschmidt, and more. Along the way, he explores how to build the shortest bridge possible between two towns, how to shop for garbage bags, how to vary speed during a race, and how to make the perfect basketball shot. Written in a conversational tone and requiring only an early undergraduate level of mathematical knowledge, When Least Is Best is full of fascinating examples and ready-to-try-at-home experiments. This is the first book on optimization written for a wide audience, and math enthusiasts of all backgrounds will delight in its lively

topics.

Digital Control Engineering

Digital Signal Processing for Communication Systems examines the plans for the future and the progress that has already been made, in the field of DSP and its applications to communication systems. The book pursues the progression from communication and information theory through to the implementation, evaluation and performance enhancing of practical communication systems using DSP technology. Digital Signal Processing for Communication Systems looks at various types of coding and modulation techniques, describing different applications of Turbo-Codes, BCH codes and general block codes, pulse modulations, and combined modulation and coding in order to improve the overall system performance. The book examines DSP applications in measurements performed for channel characterisation, pursues the use of DSP for design of effective channel simulators, and discusses equalization and detection of various signal formats for different channels. A number of system design issues are presented where digital signal processing is involved, reporting on the successful implementation of the system components using DSP technology, and including the problems involved with implementation of some DSP algorithms. Digital Signal Processing for Communication Systems serves as an excellent resource for professionals and researchers who deal with digital signal processing for communication systems, and may serve as a text for advanced courses on the subject.

When Least Is Best

The Fourier transform is one of the most fundamental tools for computing the frequency representation of signals. It plays a central role in signal processing, communications, audio and video compression, medical imaging, genomics, astronomy, as well as many other areas. Because of its widespread use, fast algorithms for computing the Fourier transform can benefit a large number of applications. The fastest algorithm for computing the Fourier transform is the Fast Fourier Transform (FFT), which runs in near-linear time making it an indispensable tool for many applications. However, today, the runtime of the FFT algorithm is no longer fast enough especially for big data problems where each dataset can be few terabytes. Hence, faster algorithms that run in sublinear time, i.e., do not even sample all the data points, have become necessary. This book addresses the above problem by developing the Sparse Fourier Transform algorithms and building practical systems that use these algorithms to solve key problems in six different applications: wireless networks; mobile systems; computer graphics; medical imaging; biochemistry; and digital circuits. This is a revised version of the thesis that won the 2016 ACM Doctoral Dissertation Award.

Why do some managers shine during a high-level crisis while others stumble? Those who have an action plan in place are the ones who can react quickly, manage rumors, and respond to victims and stakeholders sincerely and adequately while keeping their organization afloat. Leading crisis management expert Laurence Barton has spent more than two decades consulting with top companies on how to anticipate and respond to workplace threats and tragedies. In *Crisis Leadership Now* he offers concrete solutions for managing disruptive events—from industrial accidents and acts of violence to embezzlement, product recalls, and terrorism. Barton takes you through his journey of advising senior executives on crisis events and examines: The characteristics that define a true crisis Proven strategies to help you understand and respond to early warning signals Ways to mitigate threatening situations How to effectively communicate your decisions in a timely manner to employees, shareholders, customers, and other constituencies In

this forward-looking guide, Barton applies his corporate insider's insight to numerous case studies, demonstrating how such catastrophes happen to real companies and real people every day. These studies form a framework for building crisis management thinking into your company's strategic toolbox. Anticipating all forms of trouble, advising senior management and boards of directors about potential events, and devising a business recovery plan will allow your organization to rebound should tragedy strike. Barton has also created an indispensable sample crisis management plan, and includes detailed templates for addressing a wide spectrum of incidents and threats. Arming you with an arsenal of strategies, tools, and know-how, Crisis Leadership Now ensures that your company's leaders will demonstrate confidence and implement solutions in the midst of chaos.

Digital Control System Analysis and Design

Many infinite-dimensional linear systems can be modelled in a Hilbert space setting. Others, such as those dealing with heat transfer or population dynamics, need to be set more generally in Banach spaces. This is the first book dealing with well-posed infinite-dimensional linear systems with an input, a state, and an output in a Hilbert or Banach space setting. It is also the first to describe the class of non-well-posed systems induced by system nodes. The author shows how standard finite-dimensional results from systems theory can be extended to these more general classes of systems, and complements them with new results which have no finite-dimensional counterpart. Much of the material presented is original, and many results have never appeared in book form before. A comprehensive bibliography rounds off this work which will be indispensable to all working in systems theory, operator theory, delay equations and partial differential equations.

Risk Communication and Miscommunication

Effective communication can help prevent or minimize damage from environmental disasters. In *Risk Communication and Miscommunication*, Carolyn Boiarsky teaches students, technical writers, public affairs officers, engineers, scientists, and governmental officials the writing and communication skills necessary for dealing with environmental and technological problems that could lead to major crises. Drawing from research in rhetoric, linguistics, technical

communication, educational psychology, and web design, Boiarsky provides a new way to look at risk communication. She shows how failing to consider the readers' needs and the rhetorical context in which a document is read can be catastrophic and how anticipating those needs can enhance effectiveness and prevent disaster. She examines the communications and miscommunications of original e-mails, memos, and presentations about various environmental disasters, including the Columbia space shuttle breakup and the BP/Deepwater Horizon oil rig explosion, and successes, such as the Enbridge pipeline expansion and the opening of the Mississippi Spillway, offering recommendations for effective communication. Taking into account the growing need to communicate complex and often controversial issues across vast geographic and cultural spaces with an ever-expanding array of electronic media, Risk Communication and Miscommunication provides strategies for clear communication of data, ideas, and procedures to varied audiences to prevent or minimize damage from environmental incidents.

Signals, Systems, And Transforms, 4/E

This book provides an introduction to the mathematics needed to model, analyze, and design feedback systems. It is an ideal textbook for undergraduate and graduate students, and is indispensable for researchers seeking a self-contained reference on control theory. Unlike most books on the subject, *Feedback Systems* develops transfer functions through the exponential response of a system, and is

accessible across a range of disciplines that utilize feedback in physical, biological, information, and economic systems. Karl Åström and Richard Murray use techniques from physics, computer science, and operations research to introduce control-oriented modeling. They begin with state space tools for analysis and design, including stability of solutions, Lyapunov functions, reachability, state feedback observability, and estimators. The matrix exponential plays a central role in the analysis of linear control systems, allowing a concise development of many of the key concepts for this class of models. Åström and Murray then develop and explain tools in the frequency domain, including transfer functions, Nyquist analysis, PID control, frequency domain design, and robustness. They provide exercises at the end of every chapter, and an accompanying electronic solutions manual is available. Feedback Systems is a complete one-volume resource for students and researchers in mathematics, engineering, and the sciences. Covers the mathematics needed to model, analyze, and design feedback systems Serves as an introductory textbook for students and a self-contained resource for researchers Includes exercises at the end of every chapter Features an electronic solutions manual Offers techniques applicable across a range of disciplines

Continuous and Discrete Signals and Systems

Precise dynamic models of processes are required for many applications, ranging from control engineering to the natural sciences and economics. Frequently, such precise models cannot be derived using theoretical considerations alone. Therefore, they must be determined experimentally. This book treats the determination of dynamic models based on measurements taken at the process, which is known as system identification or process identification. Both offline and online methods are presented, i.e. methods that post-process the measured data as well as methods that provide models during the measurement. The book is theory-oriented and application-oriented and most methods covered have been used successfully in practical applications for many different processes. Illustrative examples in this book with real measured data range from hydraulic and electric actuators up to combustion engines. Real experimental data is also provided on the Springer webpage, allowing readers to gather their first experience with the methods presented in this book. Among others, the book covers the following subjects: determination of the non-parametric frequency response, (fast) Fourier transform, correlation analysis, parameter estimation with a focus on the method of Least Squares and modifications, identification of time-variant processes, identification in closed-loop, identification of continuous time processes, and subspace methods. Some methods for nonlinear system identification are also considered, such as the Extended Kalman filter and neural networks. The different methods are compared by using a real three-mass oscillator process, a model of a drive train. For many identification methods, hints for the practical implementation and application are provided. The book is intended to meet the needs of students and practicing engineers working in research and development, design and manufacturing.
