If you don't know the exact meaning of technical terminology or electrical/electronic slang, you risk delays, misunderstandings, and errors in your work. To complicate issues, such non-standard language doesn't match the official names as defined in applicable codes and standards. Written by NECA's H. Brooke Stauffer, this text defines electrical terms used in industry, and provides a standard source for electrical construction terminology. For the latest word on electrical jargon, order your copy today.

Massively Parallel Systems (MPSs) with their scalable computation and storage space promises are becoming increasingly important for high-performance computing. The growing acceptance of MPSs in academia is clearly apparent. However, in industrial companies, their usage remains low. The programming of MPSs is still the big obstacle, and solving this software problem is sometimes referred to as one of the most challenging tasks of the 1990's. The 1994 working conference on "Programming Environments for Massively Parallel Systems" was the latest event of the working group WG 10.3 of the International Federation for Information Processing (IFIP) in this field. It succeeded the 1992 conference in Edinburgh on "Programming Environments for Parallel Computing". The research and development work discussed at the conference addresses the entire spectrum of software problems including virtual machines which are less cumbersome to program; more convenient programming models; advanced programming languages, and especially more sophisticated programming tools; but also algorithms and applications.

This book constitutes the proceedings of the 7th International Workshop on Accelerator Programming Using Directives, WACCPD 2020, which took place on November 20, 2021. The workshop was initially planned to take place in Atlanta, GA, USA, and changed to an online format due to the COVID-19 pandemic. WACCPD is one of the major forums for bringing together users, developers, and the software and tools community to share knowledge and experiences when programming emerging complex parallel computing systems. The 5 papers presented in this volume were carefully reviewed and selected from 7 submissions. They were organized in topical sections named: OpenMP; OpenACC; and Domain-specific Solvers.

The Interactive Graphics Utility for Army NEC Automation (IGUANA) is a system designed to reduce the time required for antenna model evaluation by providing partial automation to both the data entry and the data display processes. Previous to this system, the use of existing Numerical Electromagnetics Code (NEC) for antenna evaluation required a lengthy, tedious and error-prone process involving manual measurement of three-dimensional coordinates of each significant point of the desired input structure from scale drawings (generally only Top and Side Views are available), and manual entry via keyboards. The input structures are in the form of wire models. The NEC code requires that each wire be entered individually with both end points, radius and segmentation. Complex models often required several weeks of effort to correct measurement and keyboard errors. IGUANA is provided as an aid to NEC input preparation and output display - it performs no antenna evaluations itself. This User's Guide has been prepared to explain the capabilities, functions, and operation of IGUANA.

This book provides an essential guide for the successful operation of a contract let
